# The goal of the R&D program

The TPC concept is heavily based on ALICE studies

By working it this way we benefit from a gigantic effort ALICE invested to operate TPC at the highest rates, however, we do:

- need to optimize ALICE concept to RHIC needs
- prototype and test TPC elements
- not take critical parameters for granted
- not stop at what ALICE achieved

We have a crew of people who built PHENIX tracker and who worked out ALICE concept to build the sPHENIX TPC

And the EIC detector in the future.

# Current R&D

# Mini-TPC prototype

10cm drift

10x10cm<sup>2</sup> 4-layer GEM

Pure CF<sub>4</sub>: 7.5cm/us

RCDAQ readout with  
40MHz APV25/SRS

Zigzag (chevron) pad plane

Pads 2x10mm<sup>2</sup>

# The TPC mode: 3D tracks

Pulsheight Vs X,Y Coord., Event 31814

Charge sharing by 2mm pads allows using centroid to reconstruct x-coordinate

y-coordinate is measured by timing the charge arrival

y&z-coordinate (padrow) → 3° peak as the beam angle

Reconstructed Y & Z Coordinates along Track, Event 4

Vector ZY-Angle (Native Coord. Sys.)

# The TPC Prototyping: pads

Optimize resolution:      More sharing – More accuracy  
   Less sharing – Less occupancy

Goal:                              100um resolution with 2mm pad structure  
   Linearity across the structure

Chevron patterns  
guided by simulation

Manufactured for testing in  
the lab condition

X-Y scan facility with  
collimated X-ray source

# Pads: simulation

Chevron pattern is matched to the size of the avalanche

No avalanches are contained in a single pad

No pad collects more than 85% of total charge

Minimize dependence on the avalanche size (200-600  $\mu\text{m}$ )

Minimize non-linearity along the pads

Choose design insensitive to small perturbations: variation of pad sizes, irregularities in gaps between pads, trace thickness, field distortions

2D Gaussian with  $N(e^-) \times \text{Gain} + \text{Noise}$

Pad response with field distortion (to be added) and cross talks

Analyze resolution and non-linearity

# Pads: measurement

**Reconstructed vs.  
nominal (measured)**

**Residual distortion**

Ideally, we would like  
to have no distortions

In reality it may not  
be possible.

Small distortions can  
be measured and  
corrected

**Derived correction**

**Correction applied**

# Pads: improvement

**Original  
pad design**

**Improved  
pad design**

**Same resolution  
no correction** →

# Pad hits → Track resolution

Single pad clusters are not very beneficial for the track resolution

GEM-Si Y-Pos. Correlation [Sync'd Events]

Cumulative Yres dist. [Sync'd Events]

GEM-Si X-Pos. Correlation [Sync'd Events]

Cumulative Xres dist. [Sync'd Events]

# Hit quality → Track resolution

Number of space points with 2 fired pads plays critical role

## Spatial distortion

## Angular resolution

# Field Cage

How mechanical tolerances affect the the drift field?

Using ANSYS

At the moment drift is 28 cm

0.1mm offset

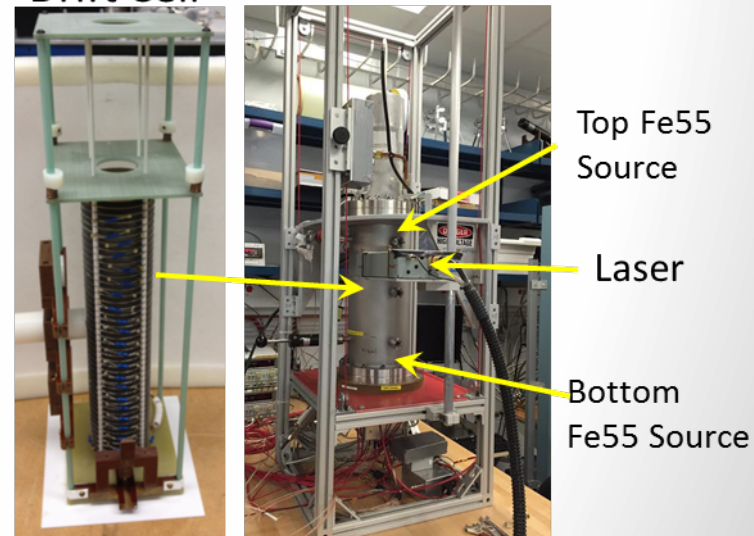

Electrostatic Vector Sum, Deviation from Nominal Drift (

# Basic gas properties

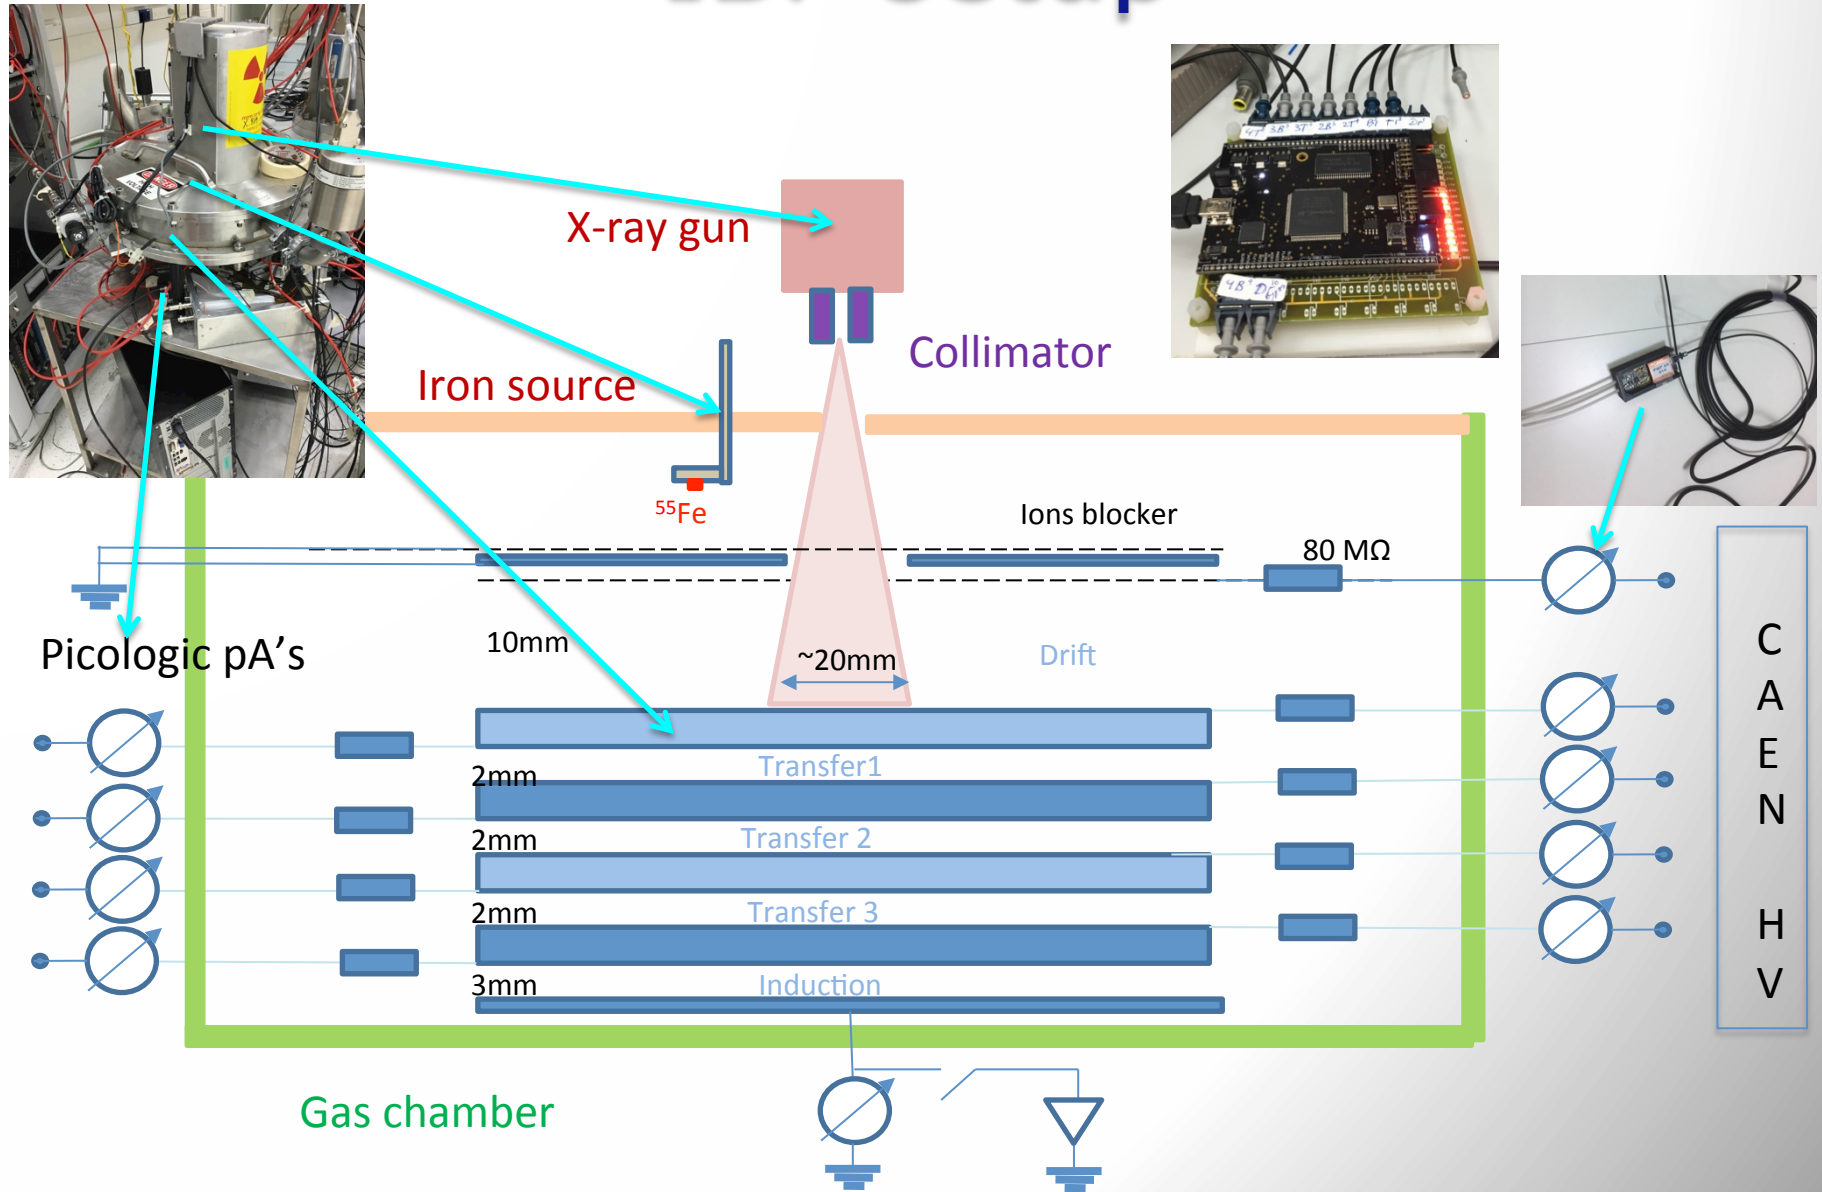

Drift Cell

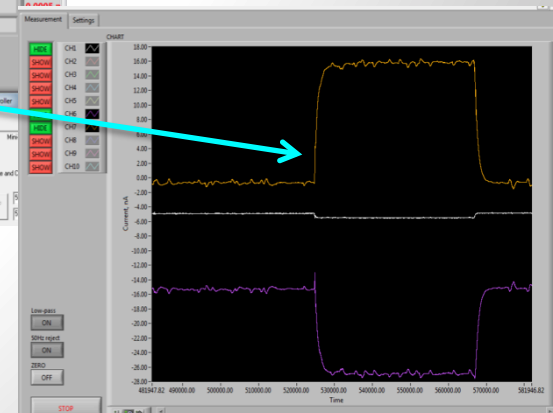

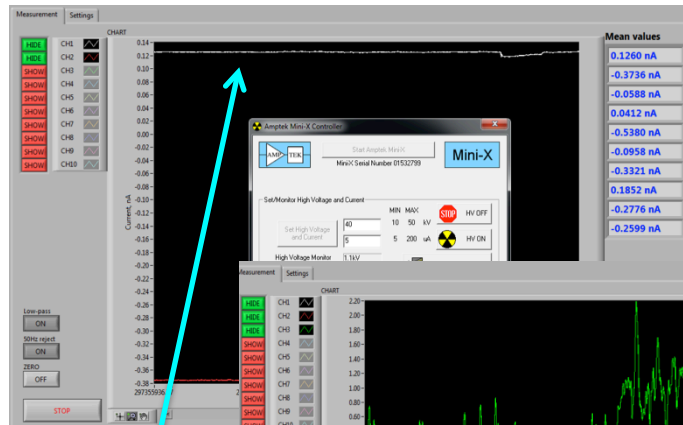

# IBF setup

# IBF measurement

Layer-by-layer control of all currents with X-ray on/off

# IBF results

Gain  $\sim 2 \times 10^3$

# Beyond the TPC

# Mini TPCČ

A step towards EIC:  
TPC and Cherenkov  
detector are compatible  
in gas and commentary  
in geometry

**Particle  
track**

**Cherenkov  
light**

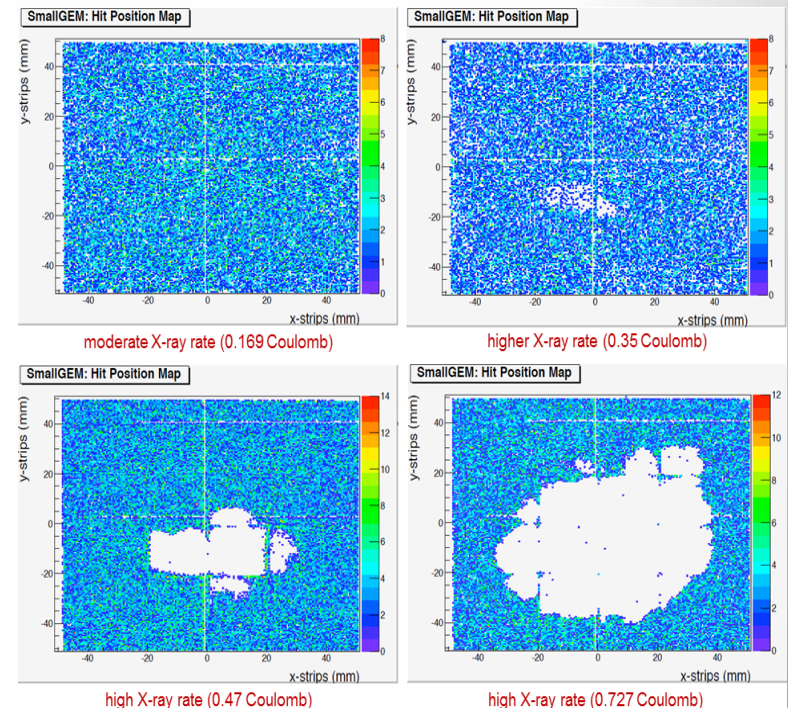

# Chromium GEMs

Thin GEMs are “thick”. About 50% of GEM mass is copper

Copperless (Cr-GEM) gives uniform response, aging properties under study

# “Frameless” GEMs

GEMs do not need heavy frames, there is no electrostatic force.

- Smaller mass
- Less dead areas
- Easier to evaporate CsI

# Summary & outlook

Beam tested Mini-TPC prototype

Prototype taking beam data in TPC mode with very simple electronics

Results show that performance goals can be met

R&D is ongoing in many directions

Optimization of the TPC gas mixture

Gain	ongoing
IBF	ongoing
Drift velocity	can be done
Diffusion	can be done
Discharge rates	planned

Optimization of the readout element

Number of layers	planned
GEM design (pitch, cobra, etc.)	planned
Additional meshes	can be done
GEM structure (Cr-GEM)	ongoing
Other elements ( $\mu$ -MEGAs, 3D-mesh)	can be done, lesser priority

Technical R&D and calculations

Optimizing chevron design	ongoing
Field cage	ongoing
Laser system	planned
Electronics integration	planned

Facility upgrades and Q&A lines

planned/ongoing
